

R Package and devtools

TOTAL POINTS 10

1. Which of the following are good reasons to build an R Package?

1 point

- ☒ R functions are only available for use in other programming languages (Python, C++) if they're included in a package.
- ☒ Users need to understand how your R functions work in order to use them and providing users with a package allows them to read your R code.
- ☒ R Packages require documentation and the package structure allows you to distribute functions and documentation together.
- ☒ An R package is a good method for distributing functions to users.

2. Which of the following files and folders are required in an R package?

1 point

- ☒ The R/ directory.
- ☒ A NAMESPACE file.
- ☒ An inst/ directory.
- ☒ The man/ directory.
- ☒ A DESCRIPTION file.
- ☒ A README.md file.

3. Which of the following files and subdirectories will be included in the initial package directory if you create a new package using the `create` function from `devtools`?

1 point

- ☒ `R/` subdirectory
- ☒ NAMESPACE

- ☒ README.md
- ☒ R project file (package name plus a `.Rproj` extension)
- ☒ README.Rmd
- ☒ ``data/`` subdirectory
- ☒ `.gitignore`
- ☒ ``man/`` subdirectory
- ☒ ``vignettes/`` subdirectory
- ☒ `.Rbuildignore`
- ☒ DESCRIPTION

4. Which of the following functions from the ``devtools`` package are you likely to use often, rather than just once per package, when building a package?

1 point

- ☒ ``load_all``
- ☒ ``create``
- ☒ ``use_readme_rmd``
- ☒ ``document``

5. What is the purpose of the DESCRIPTION file in a package?

1 point

- ☐ It describes some of the R project options for the package.
- ☒ It provides metadata on the package, including the package name, version number, authors, and dependencies.
- ☐ It provides a tutorial overview of how to use the package and is typically written in R Markdown.
- ☐ It describes all the functions that are exported by the package.

6. Which of the following statements correctly describes how R functions should be defined with the package directory?

1 point

- ☒ They should all be defined in separate R scripts (one per function) in the `R/` subdirectory.
- ☐ They should all be defined in a single R script, saved as the NAMESPACE file.
- ☐ They should all be defined in either a single or multiple R scripts in the `R/` subdirectory.
- ☐ They should all be defined in separate R scripts in the `man/` subdirectory.

7. What does the ::: operator do?

1 point

- ☐ It allows access to unexported functions in a package
- ☒ It hides functions in a package to make them inaccessible to the user
- ☐ It exports functions from a package for others to use
- ☐ It prevents users from modifying the code in a function

8. How is attaching a package namespace different from loading a namespace?

1 point

- ☒ Attaching a namespace makes functions visible only to the package that attached the namespace
- ☐ Loading a namespace places a package's functions in the global environment
- ☐ Attaching a namespace places the namespace on the search list
- ☐ Loading a namespace makes unexported functions in a package visible to the user

9. For packages that require C code, what should be installed on your system?

1 point

- ☐ A perl interpreter
- ☐ A Fortran compiler
- ☒ A C compiler from Xcode, Rtools, or equivalent package
- ☐ The appropriate header files

10. What is the purpose of the Imports field in the DESCRIPTION file?

1 point

- ☒ to indicate the packages whose functions will be used in your package
 - ☐ to indicate the version of R that is required for your package
 - ☐ to provide a brief description of what your package does
 - ☐ to indicate the license under which your package is made available
-
